

Oliver Hugh, Jason Gardosi
Perinatal Institute, Birmingham, UK

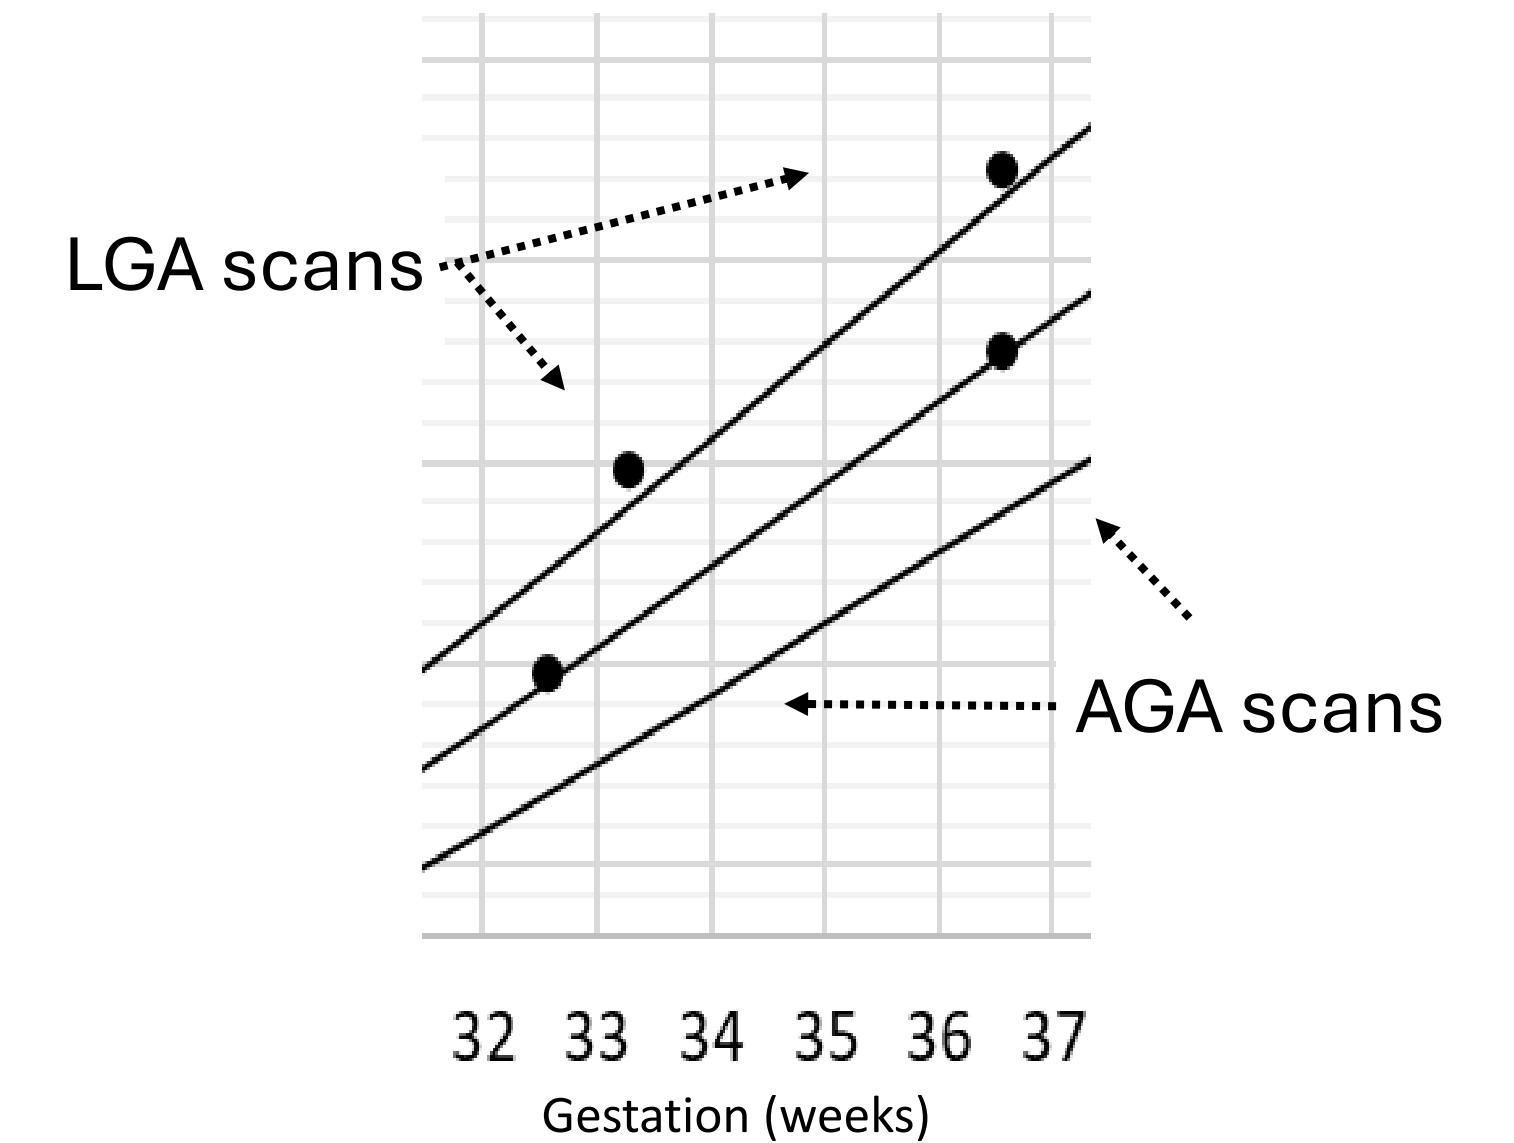

Objective

- Ultrasound estimated fetal weight (EFW) in third trimester often overestimates the weight centile of the baby at birth
- This results in high rates of false positive assessments of large for gestational age (LGA) ¹ and potentially unnecessary intervention
- We wanted to investigate whether the discrepancy could also be due to reduced growth velocity before birth

Methods

- We examined a routinely recorded database of UK pregnancies within the GAP programme from 2021 – 2023, which included
 - 12,374 pregnancies with 2 or more third trimester scans for various indications
 - where the last scan was between 35+0 and 38+0 weeks and
 - where subsequent delivery was following spontaneous onset labour.
- We selected two study cohorts (see Fig 1):
 1. where the last two EFWs were LGA above the 90th customised centile (n=725); and
 2. where the last two EFWs were AGA between 40th and 60th customised centile (n=1232).

Fig 1 LGA and AGA - EFW cohorts

Results (1): LGA

- The average gestation age of the last two scans (weeks+days) was 33+2 and 36+4, and at birth 38+5 (=15 days from last scan).
- The average EFW centiles at the two scans were 96.6 and 96.7, respectively, and 86.8 at birth.
- 58% of cases LGA at scan were not LGA at birth, i.e. PPV 42%
- Birthweights within 3 days of last scan showed the EFW to have a systematic error of +6.7% and random error of 9.0%.
- Centiles at birth following spontaneous onset of labour reduced gradually with increasing interval from last scan to delivery, down to 83 centiles after 21 days (p<0.01, Spearman's rank test).

Figure 2 Birthweight centiles at intervals after LGA EFW

Interval (days)	<=3	4-6	7-13	14-20	21+
Pregnancies (n)	47	64	258	203	153
Centile (median)	94.3	90.5	88.3	86.2	83.1

Results (2): AGA

- The average gestation age of the last two scans (weeks+days) was 32+4 and 36+4, and at birth 39+2 (=15 days from last scan)
- The average EFW centiles at the two scans were 49.7 and 50.0, respectively, and 38.0 at birth.
- Birthweights within 3 days of last scan showed the EFW to have a systematic error of +3.3%, and random error of 8.9%.
- Centiles at birth following spontaneous onset of labour ranged from 36.0 to 39.3 and showed no downward trend with increasing interval from last scan.

Figure 3 Birthweight centiles at intervals after AGA EFW

Interval (days)	<=3	4-6	7-13	14-20	21+
Pregnancies (n)	43	56	252	367	514
Centile (p50)	38.7	39.2	39.3	36.0	38.1

Summary / Conclusion

Nearly half of fetuses found to be LGA at last scan are not >90th centile at birth. This reduction in weight appears to be due to a slowing of growth of big babies at term which is not observed in AGA fetuses. This could be due to maternal constraint of growth in large babies ².
